

News Release

EMBARGOED UNTIL RELEASE AT 8:30 A.M. EDT, THURSDAY, OCTOBER 28, 2021

BEA 21-52

Technical: Karl Rohrer (301) 278-9083 gdpniwd@bea.gov
Media: Jeannine Aversa (301) 278-9003 Jeannine.Aversa@bea.gov

Gross Domestic Product, Third Quarter 2021 (Advance Estimate)

Real gross domestic product (GDP) increased at an annual rate of 2.0 percent in the third quarter of 2021 (table 1), according to the "advance" estimate released by the Bureau of Economic Analysis. In the second quarter, real GDP increased 6.7 percent.

The GDP estimate released today is based on source data that are incomplete or subject to further revision by the source agency (see "Source Data for the Advance Estimate" on page 3). The "second" estimate for the third quarter, based on more complete data, will be released on November 24, 2021.

The increase in **real GDP** in the third quarter reflected increases in private inventory investment, personal consumption expenditures (PCE), state and local government spending, and nonresidential fixed investment that were partly offset by decreases in residential fixed investment, federal government spending, and exports. Imports, which are a subtraction in the calculation of GDP, increased (table 2).

COVID-19 Impact on the Third-Quarter 2021 GDP Estimate

The increase in third quarter GDP reflected the continued economic impact of the COVID-19 pandemic. A resurgence of COVID-19 cases resulted in new restrictions and delays in the reopening of establishments in some parts of the country. Government assistance payments in the form of forgivable loans to businesses, grants to state and local governments, and social benefits to households all decreased. The full economic effects of the COVID-19 pandemic cannot be quantified in the GDP estimate for the third quarter because the impacts are generally embedded in source data and cannot be separately identified. For more information, see the [Technical Note](#) and [Federal Recovery Programs and BEA Statistics](#).

The increase in private inventory investment reflected increases in wholesale trade (led by nondurable goods industries) and in retail trade (led by motor vehicles and parts dealers). The increase in PCE reflected an increase in services that was partly offset by a decrease in goods. Within services, increases were widespread with the largest contributions coming from “other” services (mainly international travel), transportation services, and health care. The decrease in goods primarily reflected a decrease in spending on motor vehicles and parts. The increase in state and local government spending was led by employee compensation (notably, education). The increase in nonresidential fixed investment reflected an increase in intellectual property products (led by software) that was partly offset by decreases in structures and equipment.

The decrease in residential fixed investment primarily reflected decreases in improvements and in new single-family structures. The decrease in federal government spending primarily reflected a decrease in nondefense spending on intermediate goods and services after the processing and administration of Paycheck Protection Program loan applications by banks on behalf of the federal government ended in the second quarter. The decrease in exports reflected a decrease in goods that was partly offset by an increase in services. The increase in imports primarily reflected an increase in services (led by travel and transport).

The deceleration in **real GDP** in the third quarter was more than accounted for by a slowdown in PCE. From the second quarter to the third quarter, spending for goods turned down (led by motor vehicles and parts) and services decelerated (led by food services and accommodations).

Current-dollar GDP increased 7.8 percent at an annual rate, or \$432.5 billion, in the third quarter to a level of \$23.17 trillion. In the second quarter, GDP increased 13.4 percent, or \$702.8 billion (table 1 and table 3). More information on the source data that underlie the estimates is available in the [Key Source Data and Assumptions](#) file on BEA's website.

The **price index for gross domestic purchases** increased 5.4 percent in the third quarter, compared with an increase of 5.8 percent in the second quarter (table 4). **The PCE price index** increased 5.3 percent, compared with an increase of 6.5 percent. Excluding food and energy prices, the PCE price index increased 4.5 percent, compared with an increase of 6.1 percent.

Personal Income

Current-dollar personal income increased \$47.8 billion in the third quarter, in contrast to a decrease of \$1.29 trillion in the second quarter. The increase primarily reflected an increase in compensation that was partly offset by a decrease in government social benefits for unemployment insurance and direct economic impact payments to households established by the Coronavirus Response and Relief Supplemental Appropriations Act and the American Rescue Plan Act (table 8). Additional information on factors impacting personal income can be found in [Effects of Selected Federal Pandemic Response Programs on Personal Income](#).

Disposable personal income decreased \$29.4 billion, or 0.7 percent, in the third quarter, compared with a decrease of \$1.39 trillion, or 25.7 percent, in the second quarter. **Real disposable personal income** decreased 5.6 percent, compared with a decrease of 30.2 percent.

Personal saving was \$1.60 trillion in the third quarter, compared with \$1.90 trillion in the second quarter. The **personal saving rate**—personal saving as a percentage of disposable personal income—was 8.9 percent in the third quarter, compared with 10.5 percent in the second quarter.

Source Data for the Advance Estimate

Information on the source data and key assumptions used in the advance estimate is provided in a [Technical Note](#) that is posted with the news release on BEA's website. A detailed [Key Source Data and Assumptions](#) file is also posted for each release. For information on updates to GDP, see the "Additional Information" section that follows.

Definitions

Gross domestic product (GDP), or **value added**, is the value of the goods and services produced by the nation's economy less the value of the goods and services used up in production. GDP is also equal to the sum of personal consumption expenditures, gross private domestic investment, net exports of goods and services, and government consumption expenditures and gross investment.

Gross domestic income (GDI) is the sum of incomes earned and costs incurred in the production of GDP. In national economic accounting, GDP and GDI are conceptually equal. In practice, GDP and GDI differ because they are constructed using largely independent source data.

Gross output is the value of the goods and services produced by the nation's economy. It is principally measured using industry sales or receipts, including sales to final users (GDP) and sales to other industries (intermediate inputs).

Current-dollar estimates are valued in the prices of the period when the transactions occurred—that is, at "market value." Also referred to as "nominal estimates" or as "current-price estimates."

Real values are inflation-adjusted estimates—that is, estimates that exclude the effects of price changes.

The **gross domestic purchases price index** measures the prices of final goods and services purchased by U.S. residents.

The **personal consumption expenditure price index** measures the prices paid for the goods and services purchased by, or on the behalf of, "persons."

Personal income is the income received by, or on behalf of, all persons from all sources: from participation as laborers in production, from owning a home or business, from the ownership of financial assets, and from government and business in the form of transfers. It includes income from domestic sources as well as the rest of world. It does not include realized or unrealized capital gains or losses.

Disposable personal income is the income available to persons for spending or saving. It is equal to personal income less personal current taxes.

Personal outlays is the sum of personal consumption expenditures, personal interest payments, and personal current transfer payments.

Personal saving is personal income less personal outlays and personal current taxes.

The **personal saving rate** is personal saving as a percentage of disposable personal income.

Profits from current production, referred to as corporate profits with inventory valuation adjustment (IVA) and capital consumption (CCAdj) adjustment in the National Income and Product Accounts (NIPAs), is a measure of the net income of corporations before deducting income taxes that is consistent with the value of goods and services measured in GDP. The IVA and CCAdj are adjustments that convert inventory withdrawals and depreciation of fixed assets reported on a tax-return, historical-cost basis to the current-cost economic measures used in the national income and product accounts. Profits for domestic industries reflect profits for all corporations located within the geographic borders of the United States. The rest-of-the-world (ROW) component of profits is measured as the difference between profits received from ROW and profits paid to ROW.

For more definitions, see the [Glossary: National Income and Product Accounts](#).

Statistical conventions

Annual-vs-quarterly rates. Quarterly seasonally adjusted values are expressed at annual rates, unless otherwise specified. This convention is used for BEA's featured, seasonally adjusted measures to facilitate comparisons with related and historical data. For details, see the FAQ "[Why does BEA publish estimates at annual rates?](#)"

Quarterly not seasonally adjusted values are expressed only at quarterly rates.

Percent changes. Percent changes in quarterly seasonally adjusted series are displayed at annual rates, unless otherwise specified. For details, see the FAQ "[How is average annual growth calculated?](#)" and "[Why does BEA publish percent changes in quarterly series at annual rates?](#)" Percent changes in quarterly not seasonally adjusted values are calculated from the same quarter one year ago. All published percent changes are calculated from unrounded data.

Calendar years and quarters. Unless noted otherwise, annual and quarterly data are presented on a calendar basis.

Quantities and prices. Quantities, or "real" volume measures, and prices are expressed as index numbers with a specified reference year equal to 100 (currently 2012). Quantity and price indexes are calculated using a Fisher-chained weighted formula that incorporates weights from two adjacent periods (quarters for quarterly data and annuals for annual data). For details on the calculation of quantity and price indexes, see Chapter 4: Estimating Methods in the [NIPA Handbook](#).

Chained-dollar values are calculated by multiplying the quantity index by the current dollar value in the reference year (2012) and then dividing by 100. Percent changes calculated from real quantity indexes and chained-dollar levels are conceptually the same; any differences are due to rounding. Chained-dollar values are not additive because the relative weights for a given period differ from those of the reference year. In tables that display chained-dollar values, a "residual" line shows the difference between the sum of detailed chained-dollar series and its corresponding aggregate.

Updates to GDP

BEA releases three vintages of the current quarterly estimate for GDP. "Advance" estimates are released near the end of the first month following the end of the quarter and are based on source data that are incomplete or subject to further revision by the source agency. "Second" and "third" estimates are released near the end of the second and third months, respectively, and are based on more detailed and more comprehensive data as they become available.

The table below shows the average revisions to the quarterly percent changes in real GDP between different estimate vintages, without regard to sign.

Vintage	Average Revision Without Regard to Sign (percentage points, annual rates)
Advance to second	0.5
Advance to third	0.6
Second to third	0.3
Note - Based on estimates from 1996 through 2020. For more information on GDP updates, see Revision Information on the BEA website.	

Annual and comprehensive updates are typically released in late July. Annual updates generally cover at least the 5 most recent calendar years (and their associated quarters) and incorporate newly available major annual source data as well as some changes in methods and definitions to improve the accounts. Comprehensive (or benchmark) updates are carried out at about 5-year intervals and incorporate major periodic source data, as well as major conceptual improvements.

Unlike GDP, advance current quarterly estimates of GDI and corporate profits are not released because data on domestic profits and on net interest of domestic industries are not available. For fourth quarter estimates, these data are not available until the third estimate.

GDP by industry and gross output estimates are released with the third estimate of GDP.

1. Real gross domestic income is gross domestic income deflated by the implicit price deflator for gross domestic product.

Note. Users are cautioned that particularly for components that exhibit rapid change in prices relative to other prices in the economy, the chained-dollar estimates should not be used to measure the component's relative importance or its contribution to the growth rate of more aggregate series. For accurate estimates of the contributions to percent changes in real gross domestic product, use table 2.

1. Food excludes personal consumption expenditures for purchased meals and beverages, which are classified in food services.

2. This index is a supplemental measure that is based on household expenditures for which there are observable price measures. It excludes most implicit prices (for example, financial services furnished without payment) and the final consumption expenditures of nonprofit institutions serving households.

1. Gross domestic income deflated by the implicit price deflator for gross domestic product.

2. Food excludes personal consumption expenditures for purchased meals and beverages, which are classified in food services.

3. This index is a supplemental measure that is based on household expenditures for which there are observable price measures. It excludes most implicit prices (for example, financial services furnished without payment) and the final consumption expenditures of nonprofit institutions serving households.

Note. Estimates under the *Percent change from the preceding year* columns are calculated from annual data. Estimates under the *Percent change from fourth quarter to fourth quarter* columns are calculated from fourth quarter values relative to the same quarter one year prior.

1. Gross domestic income deflated by the implicit price deflator for gross domestic product.

2. Food excludes personal consumption expenditures for purchased meals and beverages, which are classified in food services.

3. This index is a supplemental measure that is based on household expenditures for which there are observable price measures. It excludes most implicit prices (for example, financial services furnished without payment) and the final consumption expenditures of nonprofit institutions serving households.

1. Personal income is also equal to national income less corporate profits with inventory valuation and capital consumption adjustments, taxes on production and imports less subsidies, contributions for government social insurance, net interest and miscellaneous payments, business current transfer payments (net), and current surplus of government enterprises, plus personal income receipts on assets, and personal current transfer receipts.

2. The current-dollar measure is deflated by the implicit price deflator for personal consumption expenditures.
